Research Methods in Human Factors and Applied Cognition:  
Task Analysis and Cognitive Task Analysis  
PSYC 645 -- Spring 2006

Instructor:    Deborah A. Boehm-Davis          Instructor:    Tom Mayfield
Phone:        (703) 993-8735                  Phone:        (703) 663-2483
Email:        dbdavis@gmu.edu                 Email:        tmayfield@evolvenow.us
Office:       2055 David King Hall            Office:       2071 David King Hall
Office Hours: Mondays 3-4 & by appt.          Office Hours: By appt.

Class Time:   Monday 4:30 – 7:10               Class Location: DK 2072 Conference Room

Catalog Description
Hands-on approach to selected current and/or classical Human Factors and Applied Cognition methods. (The exact methods will be announced in advance.) Potential methods include task analysis, critical incident analysis, reliability/error analysis, workload measures, verbal protocol analysis, user interface evaluation methods, and engineering models of human performance. May be repeated for credit.

Spring 2006 Description
For the spring 2006 semester, the course will be a project-based, hands-on approach to hierarchical task decomposition, task analysis, cognitive task analysis, cognitive walkthroughs, and protocol analysis. Task analysis techniques allow you to describe the activities (both physical and cognitive) required in the execution of a task. The course will maintain a dual emphasis on task analysis techniques for both the usability lab and advanced cognitive research. Task analyses will be conducted of routine tasks performed with standard office software as well as problem solving tasks performed with experimental software.

Course Goals
This course is designed to develop/strengthen independence in conducting (1) hierarchical task analyses; (2) cognitive task analyses using KLM, GOMS, NGOMSL, and CogTool; (3) protocol analysis, and (4) cognitive walkthroughs. The course is also designed to provide working familiarity with a number of alternative methods of task analysis.

Method of Instruction
This course will use a combination of lectures, discussion, and individual projects to convey the material to be learned. The detailed schedule of topics and weekly assignments lists the specific approach used for each class meeting.

Required text:

Reference Articles:

Fisher, C., & Sanderson, P. M. (1996 March). Exploratory sequential data analysis: Exploring continuous observational data. interactions, 25-34. (webCT)

Readings
Readings will be assigned on a weekly basis from the required texts and/or the articles listed.

Grading

Group Projects
70% of the grade will be based upon hands-on projects and class discussions of projects assigned to all students. The goal of these projects is to demonstrate mastery of the various analysis techniques. As some of the projects involve software that may be new to you, students are encouraged to work together to master the mechanics of software use (e.g., downloading a file from the web, how Excel works). However, all analyses (including, e.g., task decomposition, methods, NGOMSL statements) are expected to be the work of one individual. Exceptions to this rule will be announced in class.

If you have any uncertainty about where the line between individual vs. group effort is to be drawn while doing your projects, please come and see one of the instructors.

Late projects
All projects are due on the date announced in class by the instructor. As many of the projects will be discussed in class the day they are due or shortly thereafter, no projects will be accepted late. Students desiring an exception to this policy must contact the instructor BEFORE the project is due. Exceptions may be granted on a case-by-case basis.

Lectures/Class Discussions
15% of the grade will be based upon class participation. This is a project-oriented course and substantial in-class time will be devoted to discussions of the current project. Lectures will introduce the various techniques, their strengths and weaknesses, and theoretical foundations. All students are expected to have read all of the week’s assigned readings before coming to class and oversee the discussion of an article. Adequate preparation for a class will be demonstrated by both 1 & 2, or 3:

1. leading a class discussion of all or part of a reading and
2. explaining a topic to the rest of the class, or
3. providing a focused and detailed discussion of those aspects of the readings that you found vague or confusing

In addition, there will be email discussion of articles read for the class (using webCT). This discussion will take place BEFORE the class meets. You each will be expected to make at least a comment on each article, read all of the email discussions, and to participate in on-line discussion by responding to points raised by other students.

Individual Project/Presentations
15% of the grade will be based upon a hands-on project and classroom presentation completed by an individual student. The goal of these projects is to increase the breadth of task analysis techniques learned in the class. Each student shall select a task analysis technique (a list of suggested techniques follows). For the selected technique, you must do the following:

1. Find source materials describing the technique.
2. Apply the analysis technique to a data set (to be discussed with, and approved by, the instructors)
3. Give a classroom presentation describing the technique and illustrating your presentation with your data set. The description of the technique should include a description of the steps necessary to perform the technique, in what circumstances this technique would be
appropriately used, and a discussion of the advantages and disadvantages of using the technique.

4. Submit (a) an electronic copy of your class presentation slides and (b) a short written report in APA format (5-6 pages of text with 1-2 pages of figures or tables as appropriate), and (c) an ANNOTATED bibliography of the sources that you used in completing your project. NOTE: An annotated bibliography means that in addition to listing the sources you used, you include a 1-3 sentence summary of what is contained in that reference so that others know what can be found in that document.

Sample analysis techniques to choose from (full listing will be provided in class):
1. Activity sampling & critical incident technique
2. Charting and network techniques
3. Table-top analysis
4. Event trees
5. Failure modes and effects analysis
6. Fault trees
7. Interface survey
8. Barrier and work safety analysis
9. Ethnographic
10. Walkthroughs and talkthroughs
11. Hazard and operability analysis
12. Management oversight risk tree technique (MORT)
13. Influence diagrams

Note
There will be no exams in this course. Grades will be based on projects, class participation, and the individual project only. The final exam for this class is scheduled for May 15 and a reading day is scheduled for May 8. Although there is no final exam in the class, we may use either that time or the reading day time as a class period (particularly if we have any snow days during the semester). We will inform the class whether or not we will need to use this date no later than 3 weeks prior to the end of the class. We will discuss potential use of the reading day on the first night of class.

Honor Code
George Mason University has an Honor Code (see http://www.gmu.edu/facstaff/handbook/aD.html) that each of you accept by enrolling as a student. This code is consistent with APA’s ethical principles for working professionals. Your instructors view it as especially important that each of you adhere to that code of honor. Working in a group to discuss course materials is encouraged, but all products submitted for this course (unless specifically described as a group project) should represent your work as an individual. If you have any questions about what is permitted and what is not, please come and see one of your instructors. We are your first contact on this issue.

Outside sources (e.g., journals, books) will be required to complete some course assignments. Plagiarism is defined as in the APA’s “Ethical Principles of Psychologists and Code of Conduct” and in the Publication Manual of the American Psychological Association (see pages 292 – 298 of the Fourth Edition). Taping lectures is permitted.

Special Help
If you are a student with a disability and you need academic accommodations, please see me the first week of classes and contact the Disability Resource Center (DRC) at 703-993-2474. All academic accommodations must be arranged through that office.

Add/Drop Information
Last day to add - Feb. 7th
Last day to drop - Feb. 24th

Attendance
You are responsible for all information from each class meeting, including dates when projects are due, information not contained in the text, etc. If you miss a class, you should borrow notes from a classmate and/or download the slides from the web.

Electronic Distribution of Course Information:
On-line materials for this class can be accessed through webCT (https://webct41.gmu.edu/webct/public/home.pl). Course materials and handouts are/will be available from this website. Such materials include, but are not limited to, the syllabus, copies of the Powerpoint
slides used in class, additional class readings, guidelines/instructions for assignments, and posting location for assignments and class discussions.
# TENTATIVE CLASS SCHEDULE

Actual assignments will be adjusted in lectures weekly. Chapters cited are from the class text.
